Name: PANDUGA VENKATA JAYA SRIKANTH REDDY

Reg No: 21MIS1095

Q.2) Use a MQ-135 gas sensor to monitor air quality, temperature and humidity values and perform regression line for the data.

Read MQ-135 sensor and temperature , humidity values via Raspberry Pi.

Format the data in a structured way

- o `msg.payload = { "gas_level": msg.payload, // Sensor output "time": new`
- o `"temperature": msg.payload[0], "humidity": msg.payload[1]`
- o `"time": new Date().getTime()};`
- o `return msg;`
- **get the 10 readings**

Train a Multi-linear Regression Node with the temperature-humidity and Gas level data.

Obtain the equation for the data set

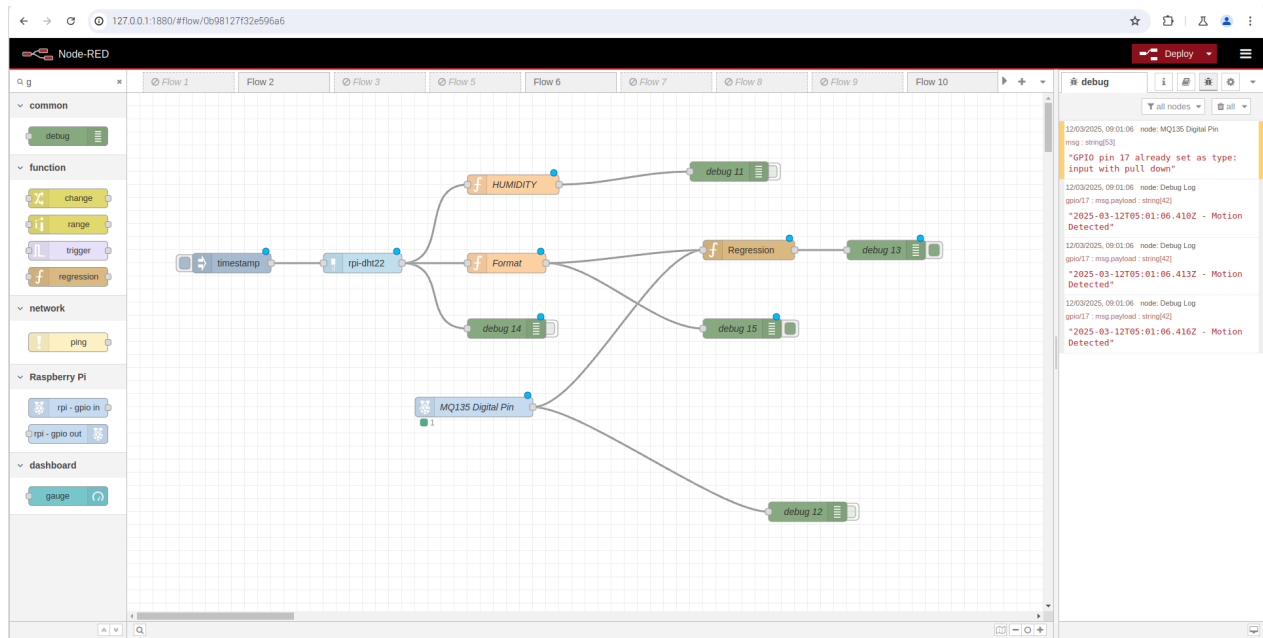

AIM:

To monitor temperature, air quality, and humidity using an MQ-135 gas sensor connected to a Raspberry Pi and to perform a multi-linear regression analysis to derive a predictive equation for the collected data.

PROCEDURE:

- First, connect the MQ-135 gas sensor and a DHT11/DHT22 sensor to the Raspberry Pi
- Install necessary libraries from the Manage Pallate for data acquisition.
- Read gas concentration from the MQ-135 sensor and temperature-humidity values from the DHT sensor at regular intervals.
- Format the data in a structured JSON format, including gas level, temperature, humidity, and timestamp.
- Collect 10 readings at a fixed interval and store them in a CSV or JSON file.
- Use Python's `sklearn.linear_model.LinearRegression` to train a multi-linear regression model with temperature, humidity, and gas level as input variables.
- Extract the regression coefficients to derive the equation in the form: $\text{Gas Level} = a + (b \times \text{Temperature}) + (c \times \text{Humidity})$.
- Finally, display the regression equation and optionally visualize the data trends using Matplotlib.
